

Are you available to be at Zoom from 1 - 4 pm ET three or four days a week?

Yes. I am fully available to host Drop-In Hours on Zoom from 1–4 pm ET four days a week, and I can maintain a consistent schedule throughout the semester.

What's your experience level with learning management systems like Canvas, Blackboard, or Moodle? What features or functions are you most comfortable with?

I have extensive experience using Canvas as a graduate student at Northeastern and through previous project work. I am comfortable creating and organizing course modules, adding assignments and quizzes, managing discussions, and customizing grading schemes. I also have experience embedding multimedia content and linking external tools, which helps in designing accessible and engaging learning materials. I've used Blackboard in the past as an undergraduate, so I'm familiar with its course structure and grading workflows as well.

In your experience, either as a student or TA, have you used a video recording tool here at Northeastern like Panopto or Canvas Studio? If so, please explain your process.

Yes. I've used Panopto within Canvas to record and share presentations for class projects. My typical process involves using Panopto to capture both the screen and audio, editing out pauses or background noise, and then embedding the final video into a Canvas page or discussion. I also add captions to ensure accessibility and clarity for all viewers.

What experience, if any, do you have as an instructor or teaching assistant? If not, please explain a time in which you have taught someone a new skill or process.

While I haven't formally served as a teaching assistant yet, I have taught peers how to use design and development tools like Figma and React during group projects. I usually break complex steps into smaller, goal-oriented tasks, demonstrate the process live, and then let others try it themselves while I guide and answer questions. This experience has strengthened my ability to explain technical concepts clearly and patiently.

Do you have experience with accessibility tools, interactive content creators, or other educational technology platforms?

Yes. I've used accessibility checkers within Canvas and Microsoft Word to ensure materials meet accessibility standards. I'm also comfortable with tools like Figma and Google Forms for creating interactive prototypes and collecting learner feedback. In several projects, I focused on designing intuitive, inclusive interfaces guided by Human-Computer Interaction principles.

Describe your experience using web communication (Zoom, Microsoft Teams, etc.) in an educational setting.

I frequently use Zoom and Microsoft Teams for classes, group meetings, and project reviews. I'm comfortable managing breakout rooms, screen sharing, recording sessions, and maintaining an organized, professional online presence. These tools have been central to my collaborative coursework and remote teamwork.

Imagine an instructor asking you to help redesign a module in their course to make the content more interactive and improve student engagement. How would you approach this from an instructional design perspective? What questions would you ask the instructor, and what tools or strategies might you explore to meet their goals?

I would begin by understanding the instructor's learning objectives and the challenges students are currently facing in that module. I'd ask what outcomes they expect, how students currently engage with the material, and what feedback they've received. Then, I would identify opportunities to introduce more active learning—such as discussion prompts, self-check quizzes, or short video explanations. Tools like Canvas Studio or H5P could make content more interactive, while clear visual design and accessibility checks would ensure usability. I would prototype one revised activity, review it with the instructor, and iterate based on feedback to ensure both pedagogical and technical alignment.
